

CLAIMS

What is claimed is:

1. A urinal bottle positioned between a first leg and a second leg of a user and adapted to receive urine from the user, the urinal bottle comprising:
 - a. a mouth positioned against the user;
 - b. a body coupled to the mouth and defining an interior cavity receiving the urine via the mouth, the interior cavity including:
 - i. a base;
 - ii. a first end proximate to the mouth and extending up from the base to a first elevation;
 - iii. a second end opposite the mouth and extending up from the base to a second elevation;
 - iv. a crest extending from the first end at the first elevation to the second end at the second elevation; and
 - v. first and second sidewalls extending from the base to the crest;
 - vi. wherein the sidewalls, base, and ends form the body; and
 - vii. wherein the interior cavity has:
 - (1) a first cross-section proximate to the first end and having a first area; and
 - (2) a second cross-section proximate to the second end and having a second area less than the first area such that the mouth, when the bottle is positioned between the first and second legs, is urged against the user.

2. The urinal bottle of claim 1, wherein the base is substantially trapezoidal.
3. The urinal bottle of claim 1, wherein the legs are convex and the first and second sidewalls include respective first and second concave surfaces mating with the respective first and second legs.
4. The urinal bottle of claim 1, wherein the mouth includes a top portion having a first radius and a bottom portion having a second radius greater than the first radius.
5. The urinal bottle of claim 1, wherein the mouth includes a lip, and wherein the lip retains a gasket disposed between the mouth and the user.
6. The urinal bottle of claim 1, further comprising a handle connected to the bottle.
7. The urinal bottle of claim 6, wherein the handle is removably connected to the crest.
8. The urinal bottle of claim 1, further comprising a handle connected to the bottle and having a proximal end extending toward the user in a direction of the mouth.
9. The urinal bottle of claim 8, wherein at least a portion of the mouth is positioned between the proximal end of the handle and the base.
10. The urinal bottle of claim 1, further comprising a handle connected to the bottle and having a distal end extending away from the user in a direction away from the mouth.

11. The urinal bottle of claim 10, wherein the base intersects the second end at at least two points of intersection, and wherein the distal end of the handle and the two points form a stable second base when the bottle is positioned with the distal end of the handle and the at least two points against a horizontal surface such that the mouth facing upward from the surface.
12. The urinal bottle of claim 10, wherein the handle further includes a proximal end extending toward the user in a second direction toward the mouth.
13. The urinal bottle of claim 1, wherein the second end is substantially flat.
14. The urinal bottle of claim 1, wherein the first elevation is greater than the second elevation.
15. A urinal bottle positioned between a first leg and a second leg of a user and adapted to receive urine from the user, the urinal bottle comprising:
 - a. a mouth positioned against the user;
 - b. a body coupled to the mouth and defining an interior cavity receiving the urine via the mouth; and
 - c. a handle connected to the body and having a proximal end extending above the mouth and toward the user in a direction of the mouth.
16. The urinal bottle of claim 15, wherein at least a portion of the mouth is positioned between the proximal end and the body.

17. The urinal bottle of claim 15, wherein the handle further includes a distal handle-end extending away from the user in a direction away from the mouth.
18. The urinal bottle of claim 15, wherein the body includes a base with a distal base-end opposite the mouth, and wherein the distal base-end and the distal handle-end lie in a plane substantially perpendicular to the base.
19. A urinal bottle positioned between a first leg and a second leg of a user and adapted to receive urine from the user, the urinal bottle comprising:
 - a. a mouth positioned against the user;
 - b. a body coupled to the mouth and defining an interior cavity receiving the urine via the mouth; and
 - c. a handle connected to the body and having a distal handle-end extending away from the user in a direction away from the mouth;
 - d. wherein the body includes a base with a distal base-end opposite the mouth, and wherein the distal base-end and the distal handle-end lie in a plane substantially perpendicular to the base.
20. The urinal bottle of claim 19, further comprising a proximal handle-end extending in a direction opposite the first-mentioned direction.
21. The urinal bottle of claim 20, wherein at least a portion of the mouth is positioned between the proximal handle-end and the body.
22. The urinal bottle of claim 20, wherein the distal handle-end and proximal handle-end are portions of the handle.
